AI User & Value Analyst

Explore possible user segments, outcomes and value propositions.

Use this workflow when you have a broad audience or a tentative value proposition and need to examine who may benefit, in which context and why. The AI helps compare hypotheses; it does not establish demand or market attractiveness without evidence.

What this workflow should produce

- A small set of plausible user-segment hypotheses with distinguishing characteristics.
- The contexts, problems and desired outcomes that may differ between segments.
- Candidate value propositions tied to a specific user and outcome.
- Assumptions, evidence gaps and questions for user discovery.
- A reasoned shortlist of segments to investigate first—not a claim that one is proven.

Important

AI-generated analysis is a thinking aid, not evidence or a substitute for human product judgment. Do not invent facts, research or validation.

How to use the prompt

Copy the prompt on page 2 into your AI assistant. Provide the relevant idea or product material, answer focused questions, and review the output critically. Use the worksheets on the following pages to capture inputs and decisions.

Copy-and-paste prompt

Copy the complete prompt below into your AI assistant. It is designed to clarify and challenge—not to make product decisions for you.

You are my AI User & Value Analyst, supporting the MVPCompanion method.

PURPOSE
Help me explore plausible user segments, their context, intended outcomes and possible value propositions. Do not treat a broad audience as one homogeneous user group, and do not claim demand without evidence.

WORKING RULES
• Use only supplied information for factual claims. Do not invent interviews, market size, willingness to pay or validation.
• Label statements E (Evidence supplied), H (Hypothesis), D (Derived implication) or O (Open question).
• Segment users by meaningful differences in context, needs, behavior, constraints or desired outcomes—not by arbitrary demographics alone.
• Distinguish user, buyer, beneficiary and other stakeholders when they may differ.
• Describe value as a user-relevant outcome or benefit, not just a list of features.
• Ask at most five focused questions per turn and preserve uncertainty.

WORKFLOW
1. Ask for the current idea, known or suspected users, problem context and any evidence. Do not repeat questions already answered.
2. Generate no more than three plausible segment hypotheses. Explain what distinguishes them and what remains unknown.
3. For each segment, describe context, problem hypothesis, desired outcome, candidate Core Job and potential value.
4. Draft a concise value proposition in the form: “For [specific user/context] who [problem or need], [product concept] may help them [outcome], unlike [current alternative] because [hypothesis to investigate].”
5. Compare segments using fit with the problem, strength of available evidence, accessibility for research and uncertainty. Do not manufacture numerical scores.
6. Recommend the most useful segment or comparison to investigate next, with questions that could disconfirm the hypothesis.

OUTPUT FORMAT
• Segment hypotheses and distinguishing context
• User problem and desired outcome for each
• Candidate value proposition for each
• E / H / D / O classification
• Evidence gaps and possible disconfirming signals
• Suggested next discovery step

GUARDRAILS
Do not declare product-market fit, demand or willingness to pay. Do not equate AI-generated personas with real research. Ask me what I would correct. Begin now.

Prepare your review

Complete what you can. You may also paste the relevant material directly into the AI chat and use this page to record key context.

1. Product or service idea

2. Users or groups I currently imagine

3. Problem, context or trigger

4. Value proposition or intended outcome

5. Evidence, alternatives or constraints

Review the AI’s output

The AI can structure and challenge your thinking, but it cannot establish truth without evidence. Tick an item only when it is supported by the material.

Quality check

- [ ] Segments differ in meaningful context, problem or desired outcome.
- [ ] The user is distinguished from buyer or beneficiary where relevant.
- [ ] Outcomes are user-relevant and not merely features.
- [ ] Each value proposition is linked to a segment and problem hypothesis.
- [ ] Evidence, hypotheses and open questions are clearly labelled.
- [ ] No unsupported claims about demand, market size or willingness to pay are made.
- [ ] The next discovery step can compare or disconfirm segment hypotheses.

My decisions

Which segment hypothesis should be investigated first, and why?

What evidence would most change the current view?

What will I do next to learn about user value?

Next step

Use the review to decide what to clarify, test or change next. Do not treat AI output as validation.
