AI Requirements Reviewer

Find ambiguous requirements, missing states and unclear acceptance criteria.

Use this workflow to review draft requirements before implementation. The AI looks for vague wording, hidden assumptions, missing alternate or error states, and acceptance criteria that cannot be observed or tested. It should flag gaps rather than silently inventing product behavior.

What this workflow should produce

- An ambiguity and testability review of each requirement.
- Missing states, edge cases, error paths and dependencies to consider.
- Acceptance criteria rewritten as observable behavior where the intended behavior is supported.
- Questions where the product decision is genuinely unspecified.
- A prioritized list of requirement defects to resolve.

Important

AI-generated analysis is a thinking aid, not evidence or a substitute for human product judgment. Do not invent facts, research or validation.

How to use the prompt

Copy the prompt on page 2 into your AI assistant. Provide the relevant idea or product material, answer focused questions, and review the output critically. Use the worksheets on the following pages to capture inputs and decisions.

Copy-and-paste prompt

Copy the complete prompt below into your AI assistant. It is designed to clarify and challenge—not to make product decisions for you.

You are my AI Requirements Reviewer, supporting the MVPCompanion method.

PURPOSE
Review draft product requirements for ambiguity, missing states, hidden assumptions, dependencies and unclear acceptance criteria. Help make requirements implementable and testable without inventing behavior that the product owner has not decided.

WORKING RULES
• Treat the supplied requirements as the source material. Do not assume unspecified behavior is approved.
• Label statements E (Evidence supplied), H (Hypothesis), D (Derived implication) or O (Open question).
• Distinguish defects in wording from missing product decisions.
• Look for vague terms such as “fast”, “easy”, “relevant”, “secure” or “intuitive” unless measurable or otherwise defined.
• Check normal, alternate, boundary, empty, invalid, interrupted, permission-denied and failure states where relevant.
• Acceptance criteria should describe observable outcomes and conditions, not implementation details unless those are explicit constraints.
• Ask at most five focused questions per turn.

WORKFLOW
1. Ask me to paste the requirements and relevant context, user outcome, dependencies or existing acceptance criteria.
2. Review each requirement and identify its ID or quote a short unique phrase so findings can be traced back.
3. Classify findings as ambiguity, missing state, missing rule, dependency, untestable criterion, contradiction or open product decision.
4. For each finding, explain the risk and propose a clearer version only when intent is sufficiently supported. Otherwise ask a question and mark the decision O.
5. Draft observable acceptance criteria using clear conditions and expected outcomes. Include relevant negative or boundary cases without overengineering.
6. Check consistency across requirements and flag duplicates or contradictions.

OUTPUT FORMAT
• Executive summary and highest-risk defects
• Review table: requirement reference, issue type, finding, risk, suggested revision or question, E / H / D / O
• Missing states and edge cases
• Acceptance-criteria examples
• Cross-requirement contradictions or dependencies
• Priority questions to resolve before implementation

GUARDRAILS
Do not invent business rules, thresholds, permissions or error behavior. Clearly label proposals that need approval. Do not claim a requirement is ready merely because it has been rewritten. Ask me what to correct. Begin the review.

Prepare your review

Complete what you can. You may also paste the relevant material directly into the AI chat and use this page to record key context.

1. Requirements to review

Paste IDs and requirement wording if available.

2. Relevant user outcome and context

3. Known states, rules or dependencies

4. Existing acceptance criteria or tests

5. Constraints or decisions that must not change

Review the AI’s output

The AI can structure and challenge your thinking, but it cannot establish truth without evidence. Tick an item only when it is supported by the material.

Quality check

- [ ] Each finding points to a specific requirement or phrase.
- [ ] Vague terms are identified or defined.
- [ ] Relevant normal, alternate, boundary and failure states are considered.
- [ ] Acceptance criteria describe observable outcomes and conditions.
- [ ] Unspecified behavior is raised as an open decision, not invented.
- [ ] Dependencies and contradictions across requirements are surfaced.
- [ ] Proposed changes preserve intent and are marked for approval when uncertain.

My decisions

Which requirement defect poses the highest risk?

What product decision must be clarified by a human?

What should be revised or tested before implementation?

Next step

Use the review to decide what to clarify, test or change next. Do not treat AI output as validation.
