MVP Hypothesis & Evidence Tracker

A practical worksheet for making uncertainty visible and tracking what you learn.

Use this tracker to record the assumptions that matter to your MVP, the evidence available so far, and the next learning step. Keep observed information separate from interpretation. Update the tracker when new evidence changes your understanding.

Use the MVPCompanion labels

E · Evidence	Information actually observed or supplied, with its source and context.
H · Hypothesis	A plausible claim that is not yet sufficiently supported.
D · Derived	An implication drawn from other stated information; record the reasoning.
O · Open question	An important unknown or unresolved decision.

How to use the tracker

1. Write each important hypothesis as a clear, challengeable statement.
2. Record supporting and contradicting evidence, including source and context.
3. Note what the evidence does—and does not—justify concluding.
4. Prioritize the uncertainty by importance to the MVP decision, not by how easy it is to discuss.
5. Define a next learning step and update the status after learning.

Important

Evidence is not automatically conclusive. A small or biased sample may support only a narrow claim. AI-generated statements are not evidence unless independently supported.

1 · Project context & hypothesis register

Use one copy of this page per project, or duplicate the register page if you have more hypotheses than fit here.

Project context

Product / project name

Primary user and context

Intended user outcome

Hypothesis register

#	Hypothesis / claim	Why it matters	Status
1			☐ H ☐ E ☐ D ☐ O
2			☐ H ☐ E ☐ D ☐ O
3			☐ H ☐ E ☐ D ☐ O
4			☐ H ☐ E ☐ D ☐ O

Status is provisional
A claim may be supported in one context and remain uncertain in another. Record the source and limits on the evidence page.

2 · Evidence log

Record a specific observation, source or data point—not just a conclusion. Duplicate this page when needed.

Evidence record

EVIDENCE ITEM 1

Observation / data point

Source, date and context

What this supports / does not support

EVIDENCE ITEM 2

Observation / data point

Source, date and context

What this supports / does not support

Evidence quality prompts

- [ ] Is the source credible and relevant to the claim?
- [ ] Is the sample or context narrow, biased or incomplete?
- [ ] Is there contradictory evidence or a plausible alternative explanation?

3 · Learning plan & decision log

Choose the next step that is most likely to reduce a consequential uncertainty. Prefer a specific question and an observable signal over a vague intention to “do more research.”

Prioritize the uncertainty

Importance	If this claim is wrong, how much would it change the product, scope or investment decision?
Uncertainty	How strong, relevant and consistent is the current support?
Learning cost	What is the smallest reasonable step that could produce useful evidence?

Learning question / hypothesis to investigate

Method or smallest useful test

What observation would support or challenge it?

How could the result change the product decision?

4 · Review & update

After the learning step, update the hypothesis rather than simply adding notes. Record what changed, what remains uncertain and which downstream decisions may be affected.

Current status

☐	**Supported for now**	Evidence supports the claim within the recorded context; limits remain.
☐	**Partly supported**	Some aspects are supported, but important conditions or segments remain uncertain.
☐	**Not supported / contradicted**	Evidence challenges the claim or supports an alternative explanation.
☐	**Still open**	Available information does not resolve the claim.
☐	**Revised**	The hypothesis has been narrowed, reframed or replaced.

Updated hypothesis / conclusion (with limits)

What did we learn?

What product decision or scope item changes?

Owner and review date

Traceability check

- ☐ Problem / user / outcome affected is identified.
- ☐ Related Core Job, capability or requirement is reviewed.
- ☐ Acceptance criteria, metric or learning plan is updated if needed.

Learning loop

Evidence → Learning → Revised Hypothesis → Product Change
